Analysis of Plots

1) Loss Plot: Training Loss and Validation Loss V/s Epochs

In all cases training loss decreases with the number of epochs indicating that the model is learning the data on which it is being trained similarly in majority of the cases validation loss also decreases like those in bilstm and gru models for task-1 This indicates that the model performs well on unseen data, or effective learning. Conversely, in a few cases the validation loss increases but training loss continues to decrease, this may be due to a case of overfitting of the model.

2) F1 Plot: Training Macro-F1-score and Validation Macro-F1-score V/s Epochs

The training and Validation Macro-F1-scores versus epochs provides insights into the model's performance throughout training. We observe in most cases like in task 2 that the macro f1 scores for training and validation increase with the number of epochs. Indicating a good performance. However, for a few cases of task 1 models the training/validation macro-f1 scores also decrease after a certain number of epochs. In some plots, we can observe that the validation F1 score first increases with each epochs, then starts decreasing at some point. This may be due to a case of overfitting of the model, where the model becomes overly sensitive to noise or specific characteristics of the training data that do not generalize well to unseen examples. As a result, while the F1 score continues to increase on the training data, it may start to decrease on the validation or test data, indicating that the model's performance is deteriorating.

Furthermore, we observe that bilstm models significantly perform better than those used in part - 2 i.e. GRU, vanilla RNN & LSTM. This can be seen from cases of task 1 and task 2 where test macro - f1 scores of embeddings: word2vec, GloVe, and fasttext for bilstm increase as compared to part - 1 models.
